

Open door policy?

Does Your Backup Software Create a Big Hole in Your Firewall?

With UltraBac Software's advanced backup technology this issue is practically eliminated. Previously there wasn't a way to securely back up your network through a firewall without excessive risk, or having to place your entire backup infrastructure in the DMZ. The new version of UltraBac will allow you to quickly and easily back up your servers and workstations without having to compromise security by opening many ports in your system. This innovative solution allows you great flexibility by uniquely regulating exactly which ports are used for communication. A one way connection is initiated from inside your firewall so that the outside communications are initiated using a defined range. This means that networks remain more secure by eliminating unnecessary port usage, and you can easily configure your firewall for this defined range to include only your expected backup clients. If you need to better lock down your environment then you need UltraBac's backup and disaster recovery protection. Your organization's data is an extremely valuable asset. Keep your data safe and secure **inside your firewall**, no open door policy allowed.
